

## Official Announcement – UniHA National Tender – Ultra-Low-Field Portable MRI

**[Toronto, ON - November 4th, 2025]** - UpCare Europe is proud to announce that it has been designated the successful bidder for Lot 10 of the UniHA national tender “Cross-Sectional Imaging 2025–2029” – Ultra-Low-Field Portable MRI.

Following significant development already achieved in North America, and subsequent to obtaining the CE mark in December 2024, this award constitutes a first in France and Europe, with the introduction of Hyperfine's Swoop®, the world's first portable MRI operating at 0.064 Tesla.

This revolutionary technology makes it possible to perform brain imaging exams directly at the patient's bedside—in intensive care, emergency rooms, the operating room, neurovascular units, or pediatrics—promoting faster, safer, and more equitable access to diagnostic imaging.

Within the scope of the “Cross-Sectional Imaging 2025–2029” tender, Lot 10 represents an estimated potential of 25 million euros over 4 years, benefiting UniHA's network of 1,550 public hospitals, including 124 Groupements hospitaliers de territoire (GHT) (Territorial Hospital Groups).

This referencing opens a strategic national channel for the adoption of bedside MRI, confirming the strong market potential and institutional commitment to innovation in medical imaging.

Beyond major hospital centers, this initiative creates new opportunities for remote or underserved regions, where access to MRI remains limited. By decentralizing imaging capabilities, the Swoop® system establishes a new paradigm of proximity, speed, and equity in patient care.

Thanks to the vision and leadership of UniHA, France confirms its role as a global pioneer in medical imaging, combining clinical intelligence, technological innovation, and social responsibility to shape the future of healthcare.

UpCare also wishes to commend the vision of Hyperfine, whose constant innovation made this step possible. The Swoop® is the result of several years of research and engineering excellence, guided by the conviction that access to imaging must be universal, regardless of infrastructure or geography.

This collaboration between Hyperfine and UpCare, within the framework of the UniHA tender, illustrates how partnership, vision, and innovation can transform healthcare systems worldwide.

*"This selection marks a major milestone in the evolution of patient care. Ultra-low-field MRI is not just a technological innovation; it is a concrete response to current medical, logistical, and socio-economic challenges. I commend the foresight of UniHA, Hyperfine, and the French hospital community, who once again demonstrate their leadership in imaging access and quality."*
